

HashiCorp Nomad at Allianz

Roman Pogribnyi,
Allianz Technology

ABA at Allianz

Goal: Create Business Value and improve processes using AI and new data technologies

Share knowledge between OEs

Facilitate processes

DSP Platform at Allianz

- Provides infrastructure ABA
- Basically: **developing, deploying, and operating data driven products end to end.**

Lifecycle of a data-driven product

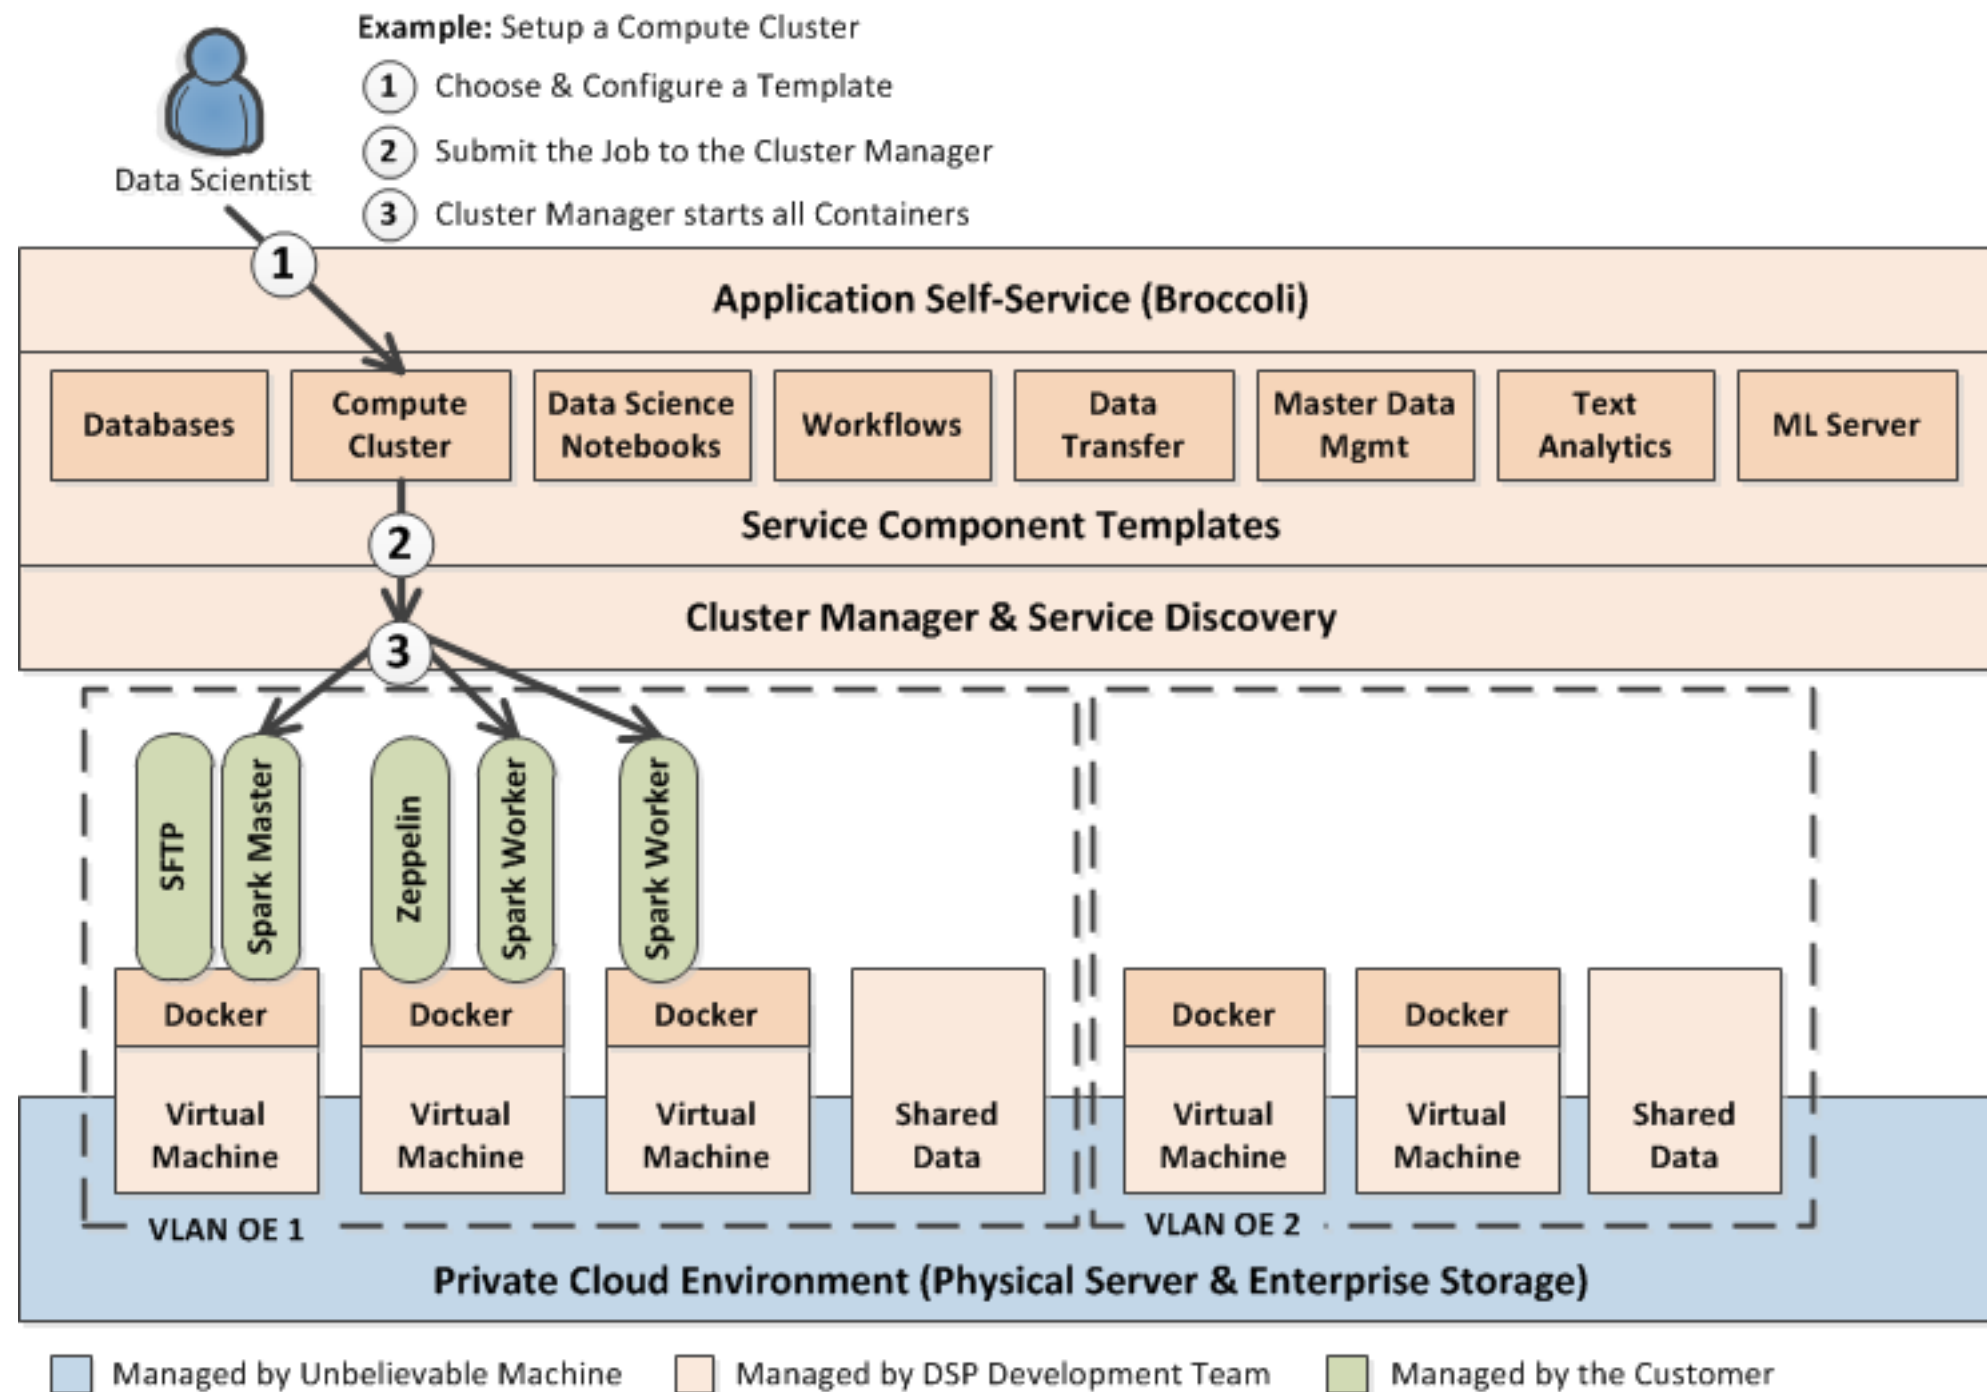

Use Cases of DSP

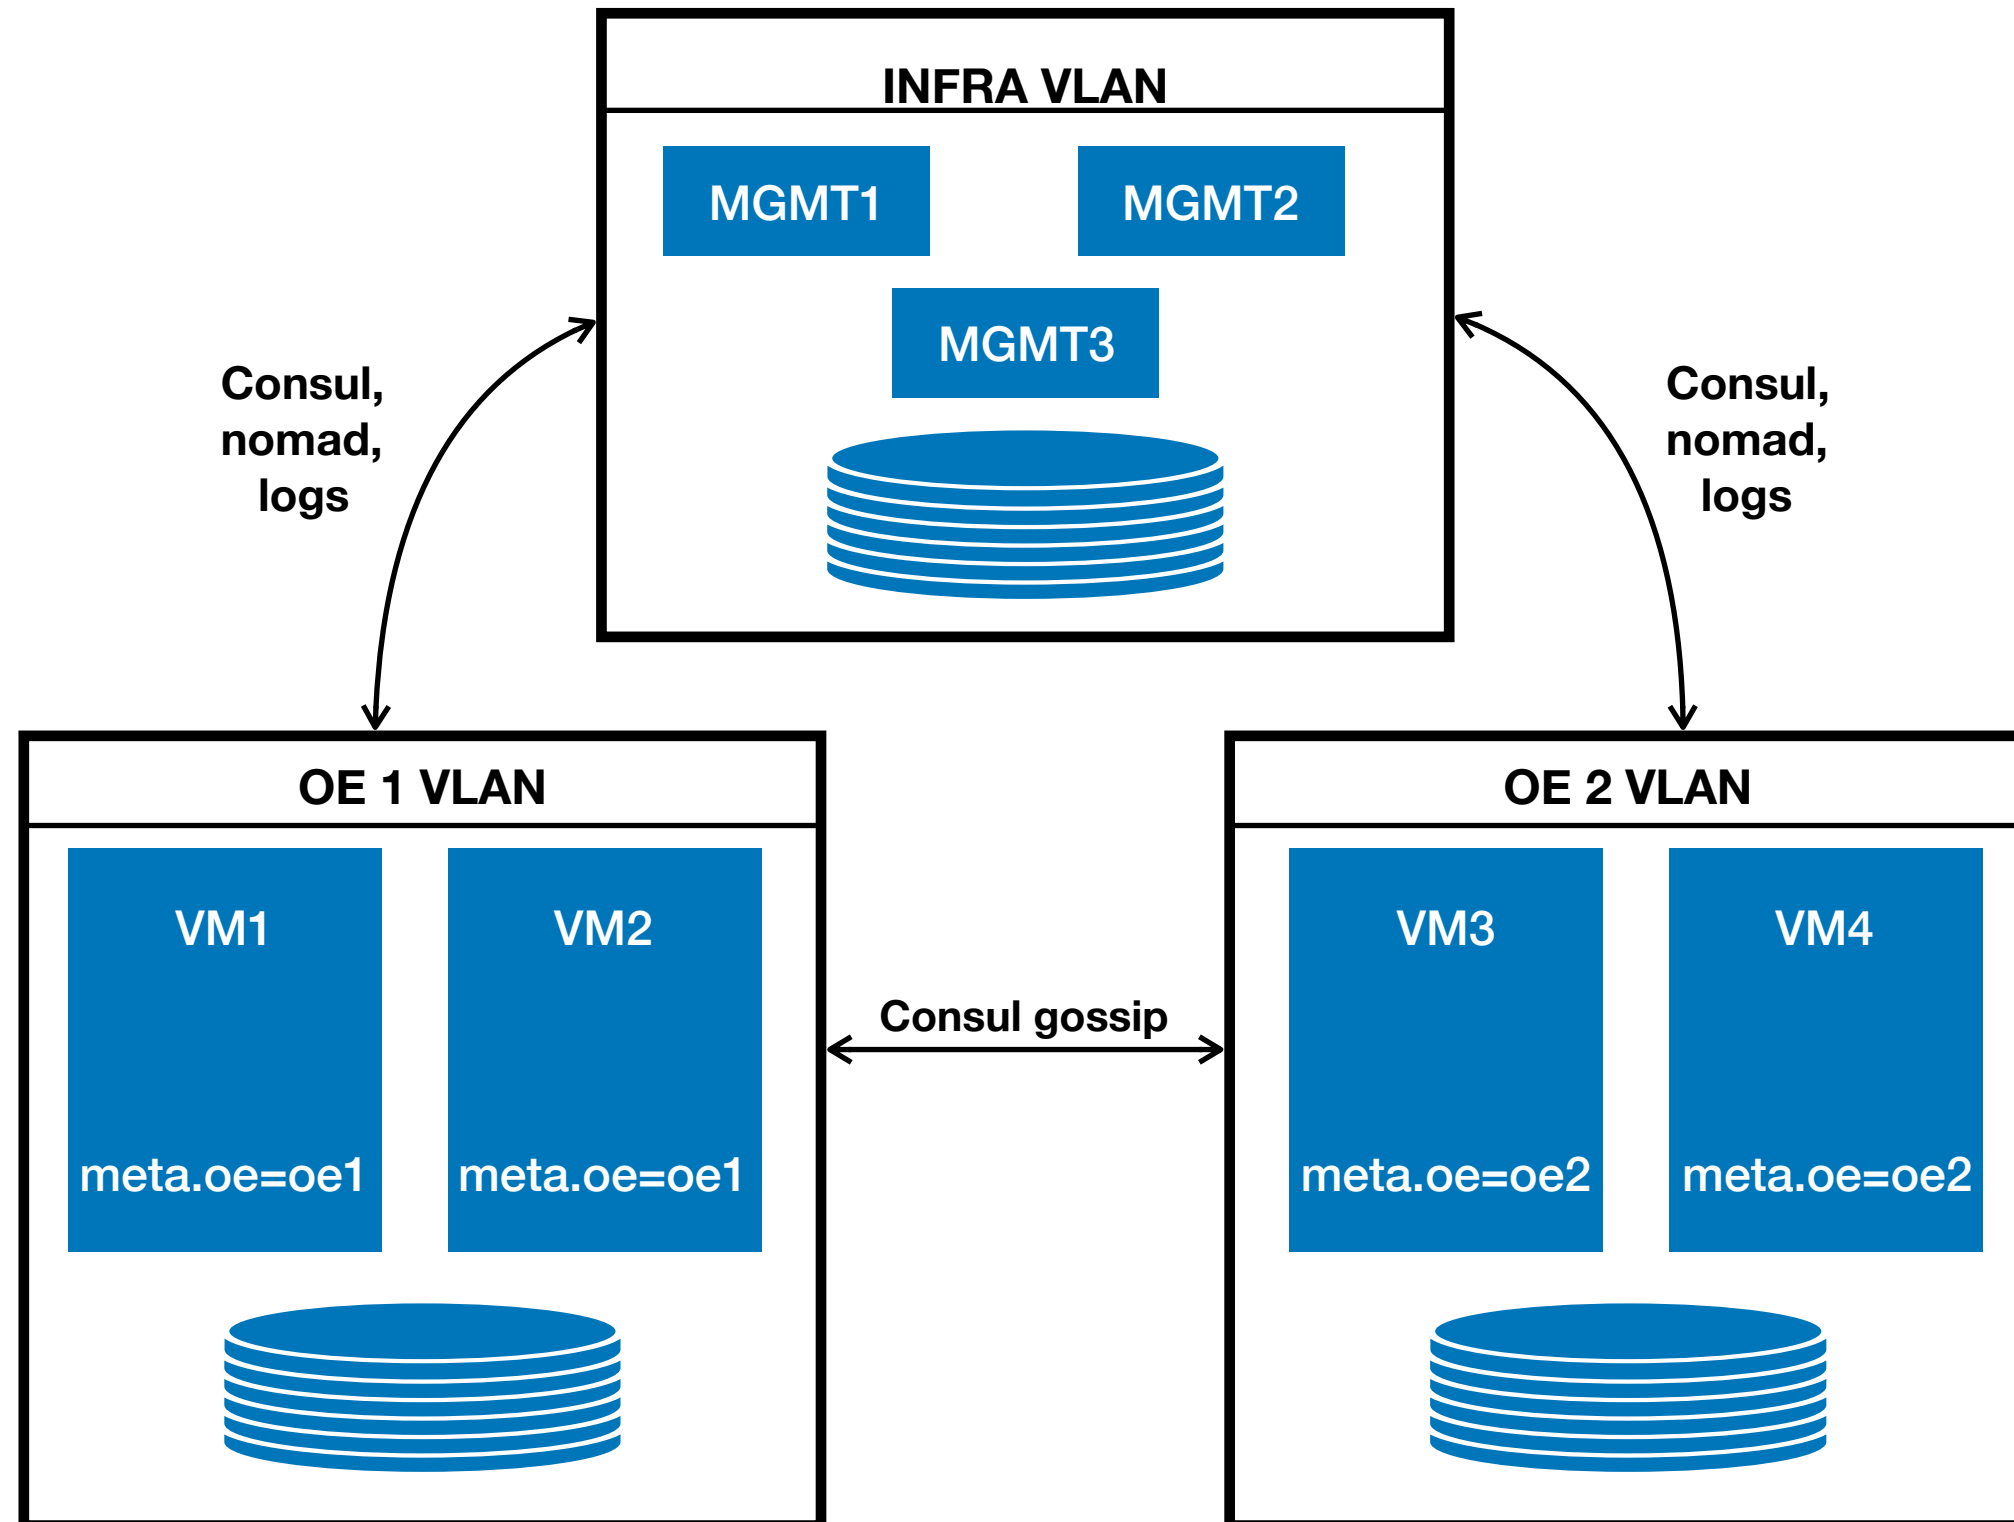

- Explore data from OEs and 3rd parties
- Quickly prototype a model
- Create an API based on this model

Current Setup

Old Network Structure

Usage of Consul & Vault

Consul:

- Service Discovery
- Health checks of services
- Health checks of VMs

Vault:

- Intermediate CA
- Secrets for CI/CD

Self-service for Nomad: Cluster Broccoli

- Create / configure / monitor Nomad jobs
- <https://github.com/Data-Science-Platform/cluster-broccoli>

Broccoli: list jobs

Broccoli: job definition

```
Broccoli job definition

{
  "Job": {
    "Region": "global",
    "ID": "{{id}}",
    . . .
  },
  "TaskGroups": [
    {
      . . .
      "Tasks": [{
        . . .
        "Resources": {
          "CPU": {{resources_cpu}},
          "MemoryMB": {{resources_memory_mb}},
          . . .
        }
      ]
    }
  ]
}
```

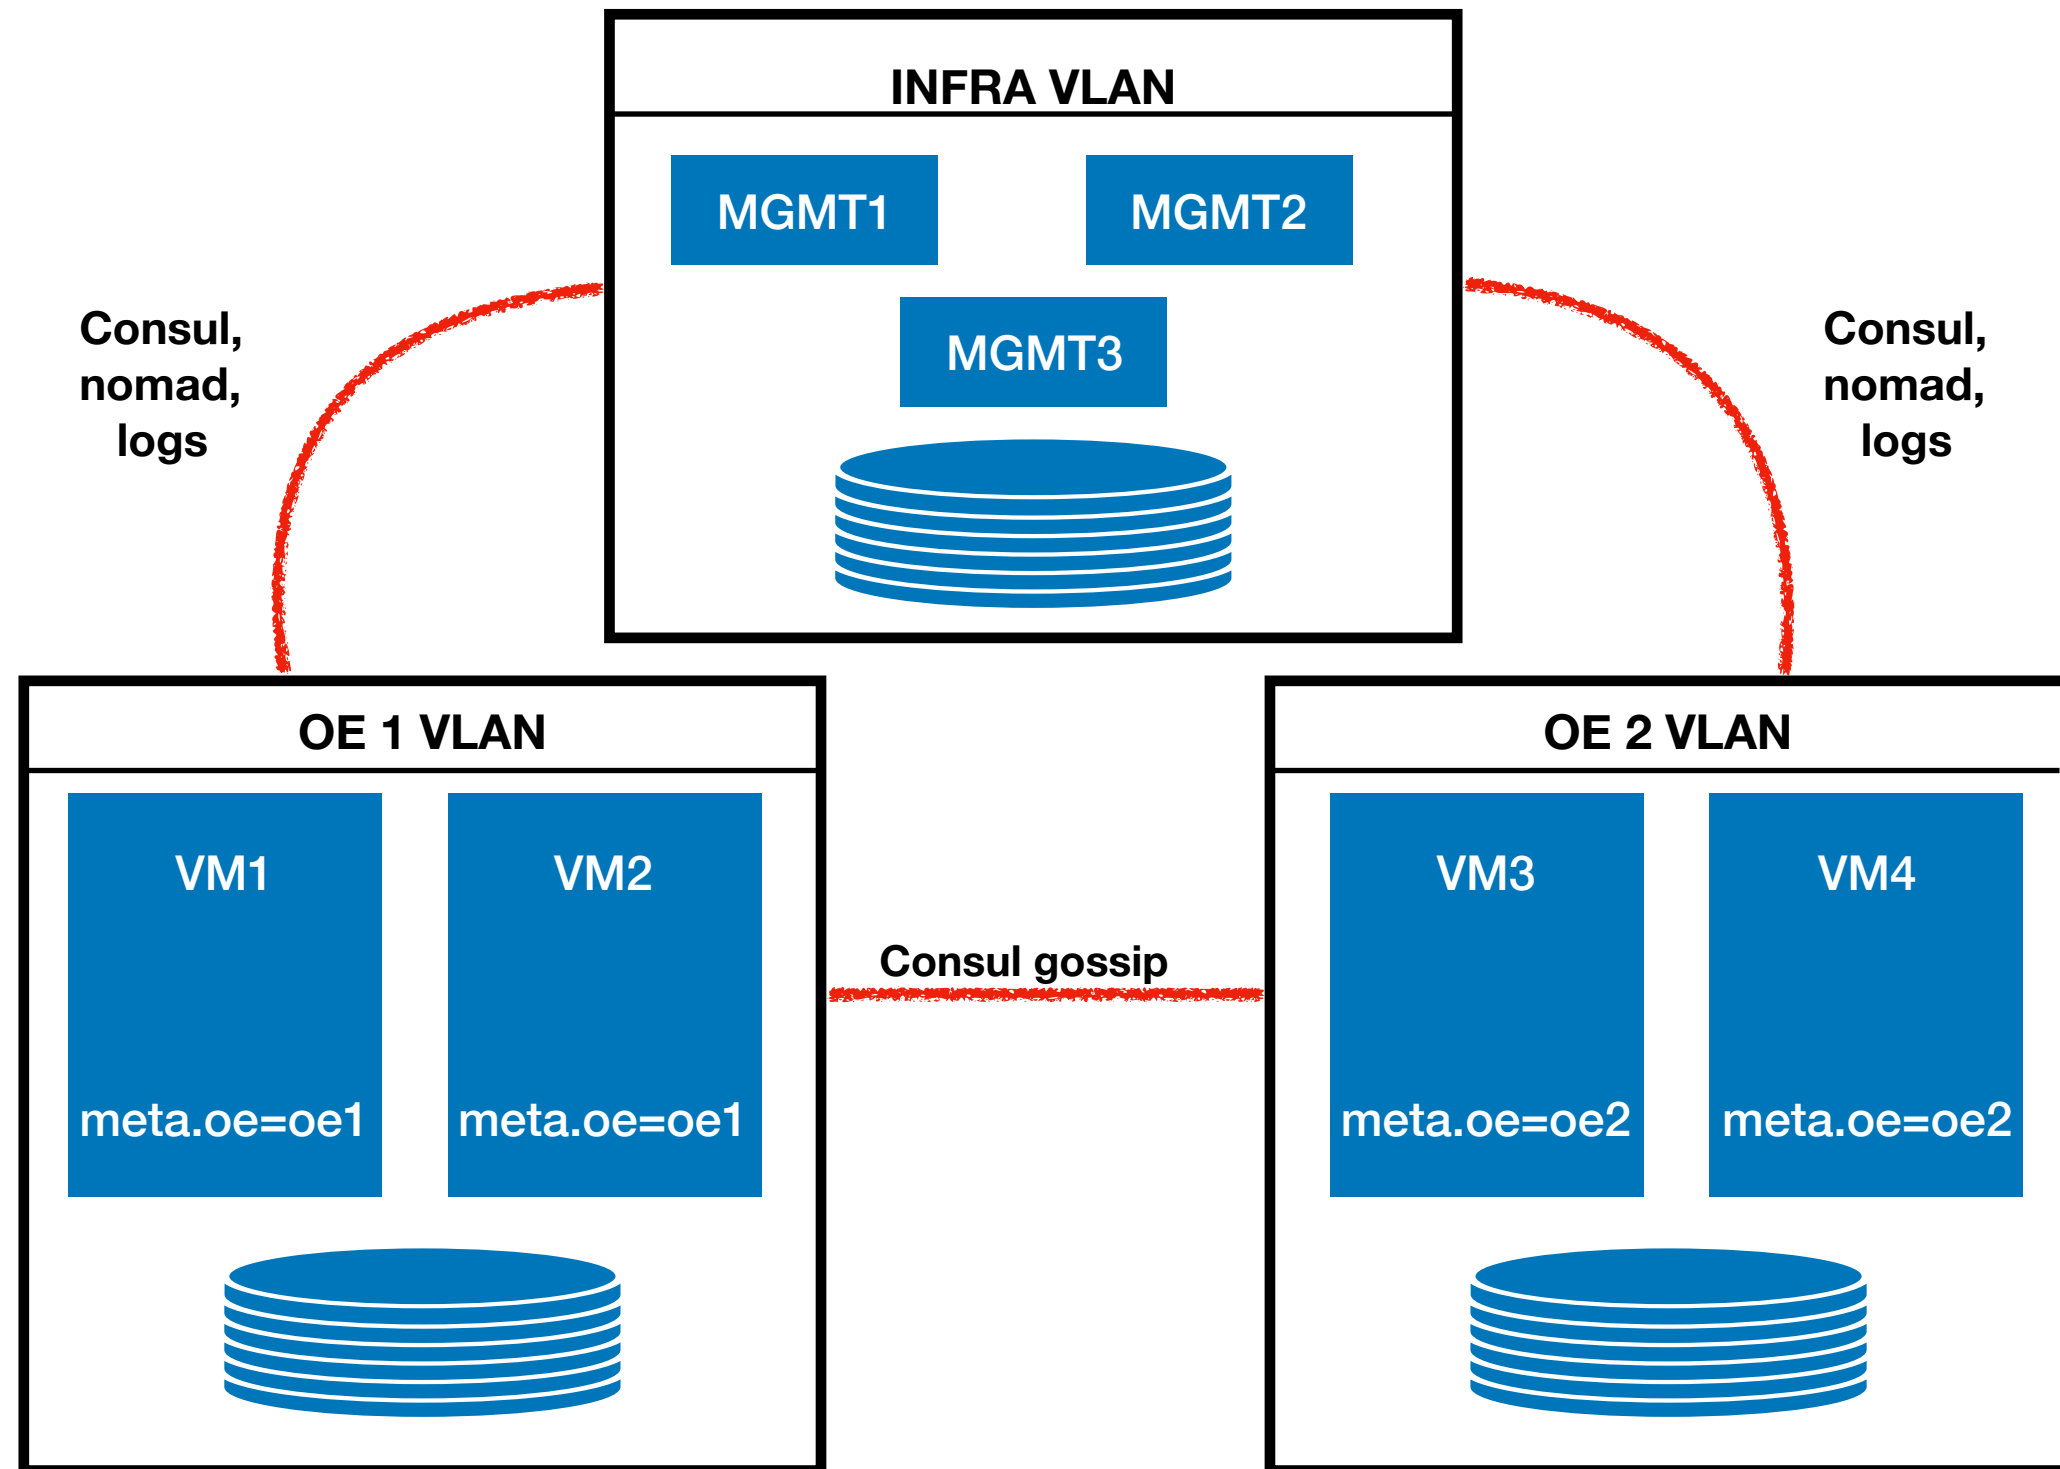

Why we needed a change

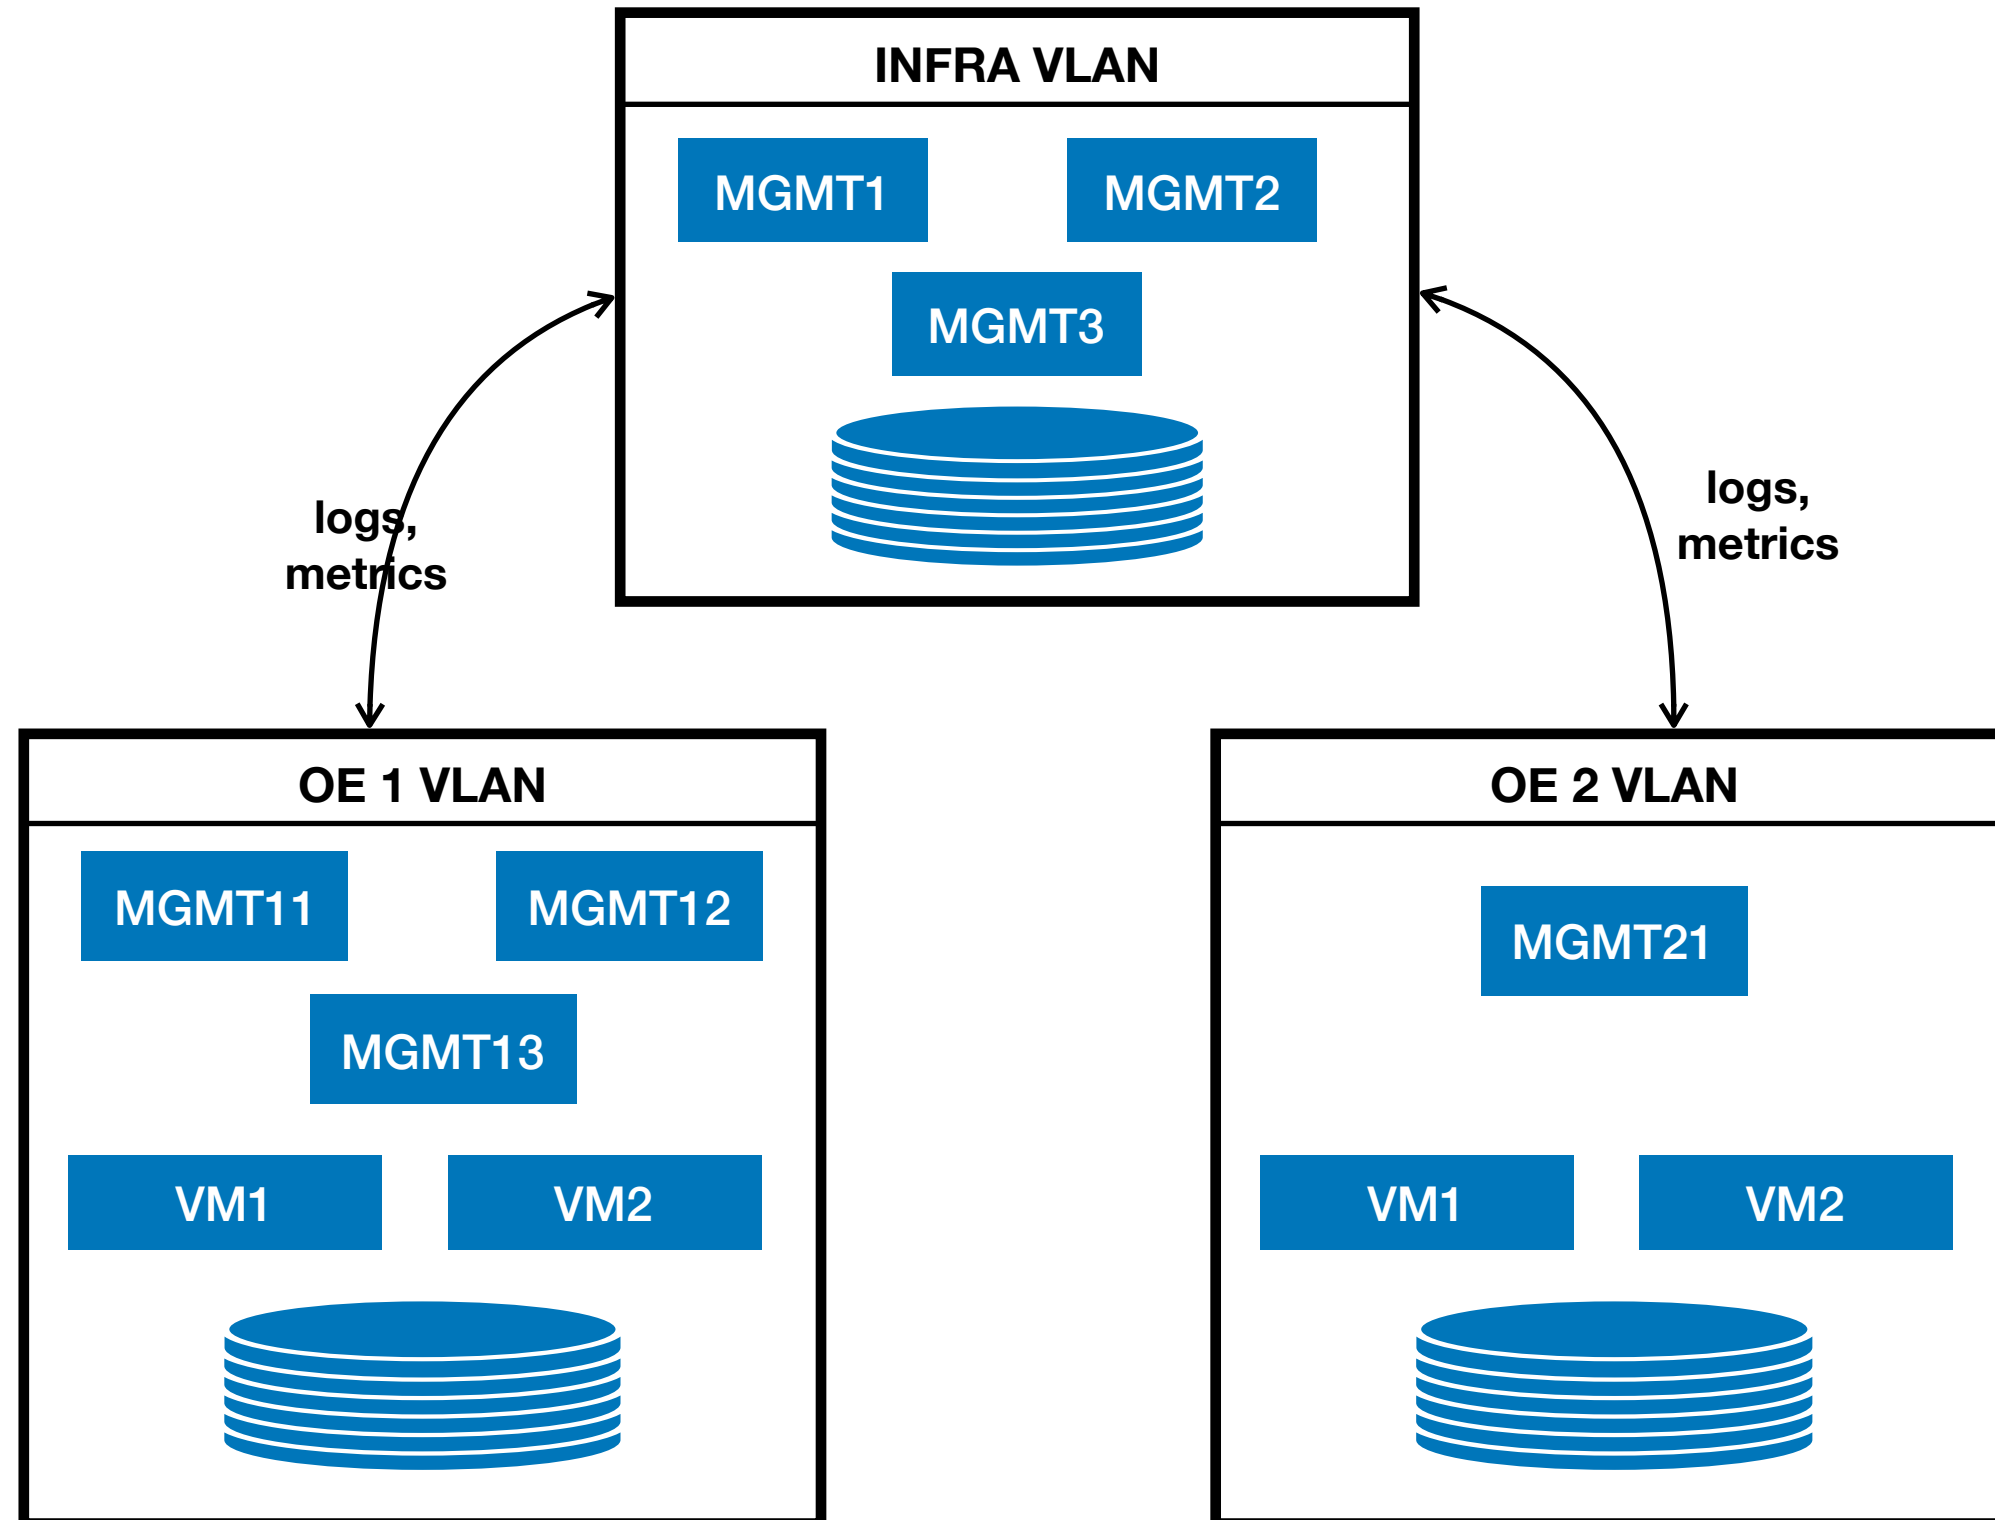

- No ACLs in place(redundant anyways)
- *Full* self-service for customer
- Allow VCs in client VLANs

Option 1: Introduce ACLs

Option 2: Dedicated Nomad

Option 3: Centralised Nomad(EE)

- Define ACLs on namespaces
- Resource quotas(if needed)
- Sentinel policies for allocation checks

Nomad EE: Namespace isolation

```
{
  "namespace": {
    "default": {
      "policy": "read"
    },
    "azde": {
      "policy": "write"
    }
  },
}
```

Nomad EE: Resource quotas

- Each Namespace uses 100% of resources
- Split only within teams

Nomad EE: Resource quotas

```
$ cat azde-project1-quota.hcl
name = "azde-project1-quota"
description = "Project 1 of AZDE OE"

# Create a limit for the global region. Additional limits may
# be specified in-order to limit other regions.
limit {
  region = "global"
  region_limit {
    cpu = 40000
    memory = 100000
  }
}

$ nomad namespace apply -quota azde-project1-quota azde-project1-ns
```

● ● ●

Nomad EE: Sentinel policies

```
$ cat allocation.sentinel
get_constraint_for_oe = func(oe){
  return {
    "LTarget": "${meta.oe_tag}",
    "RTarget": oe,
    "Operand": "=",
  }
}

check_namespace_alloc = func() {
  ns = job.namespace
  return job.constraints contains get_constraint_for_oe(ns)
}

main = rule { check_namespace_alloc() }
```

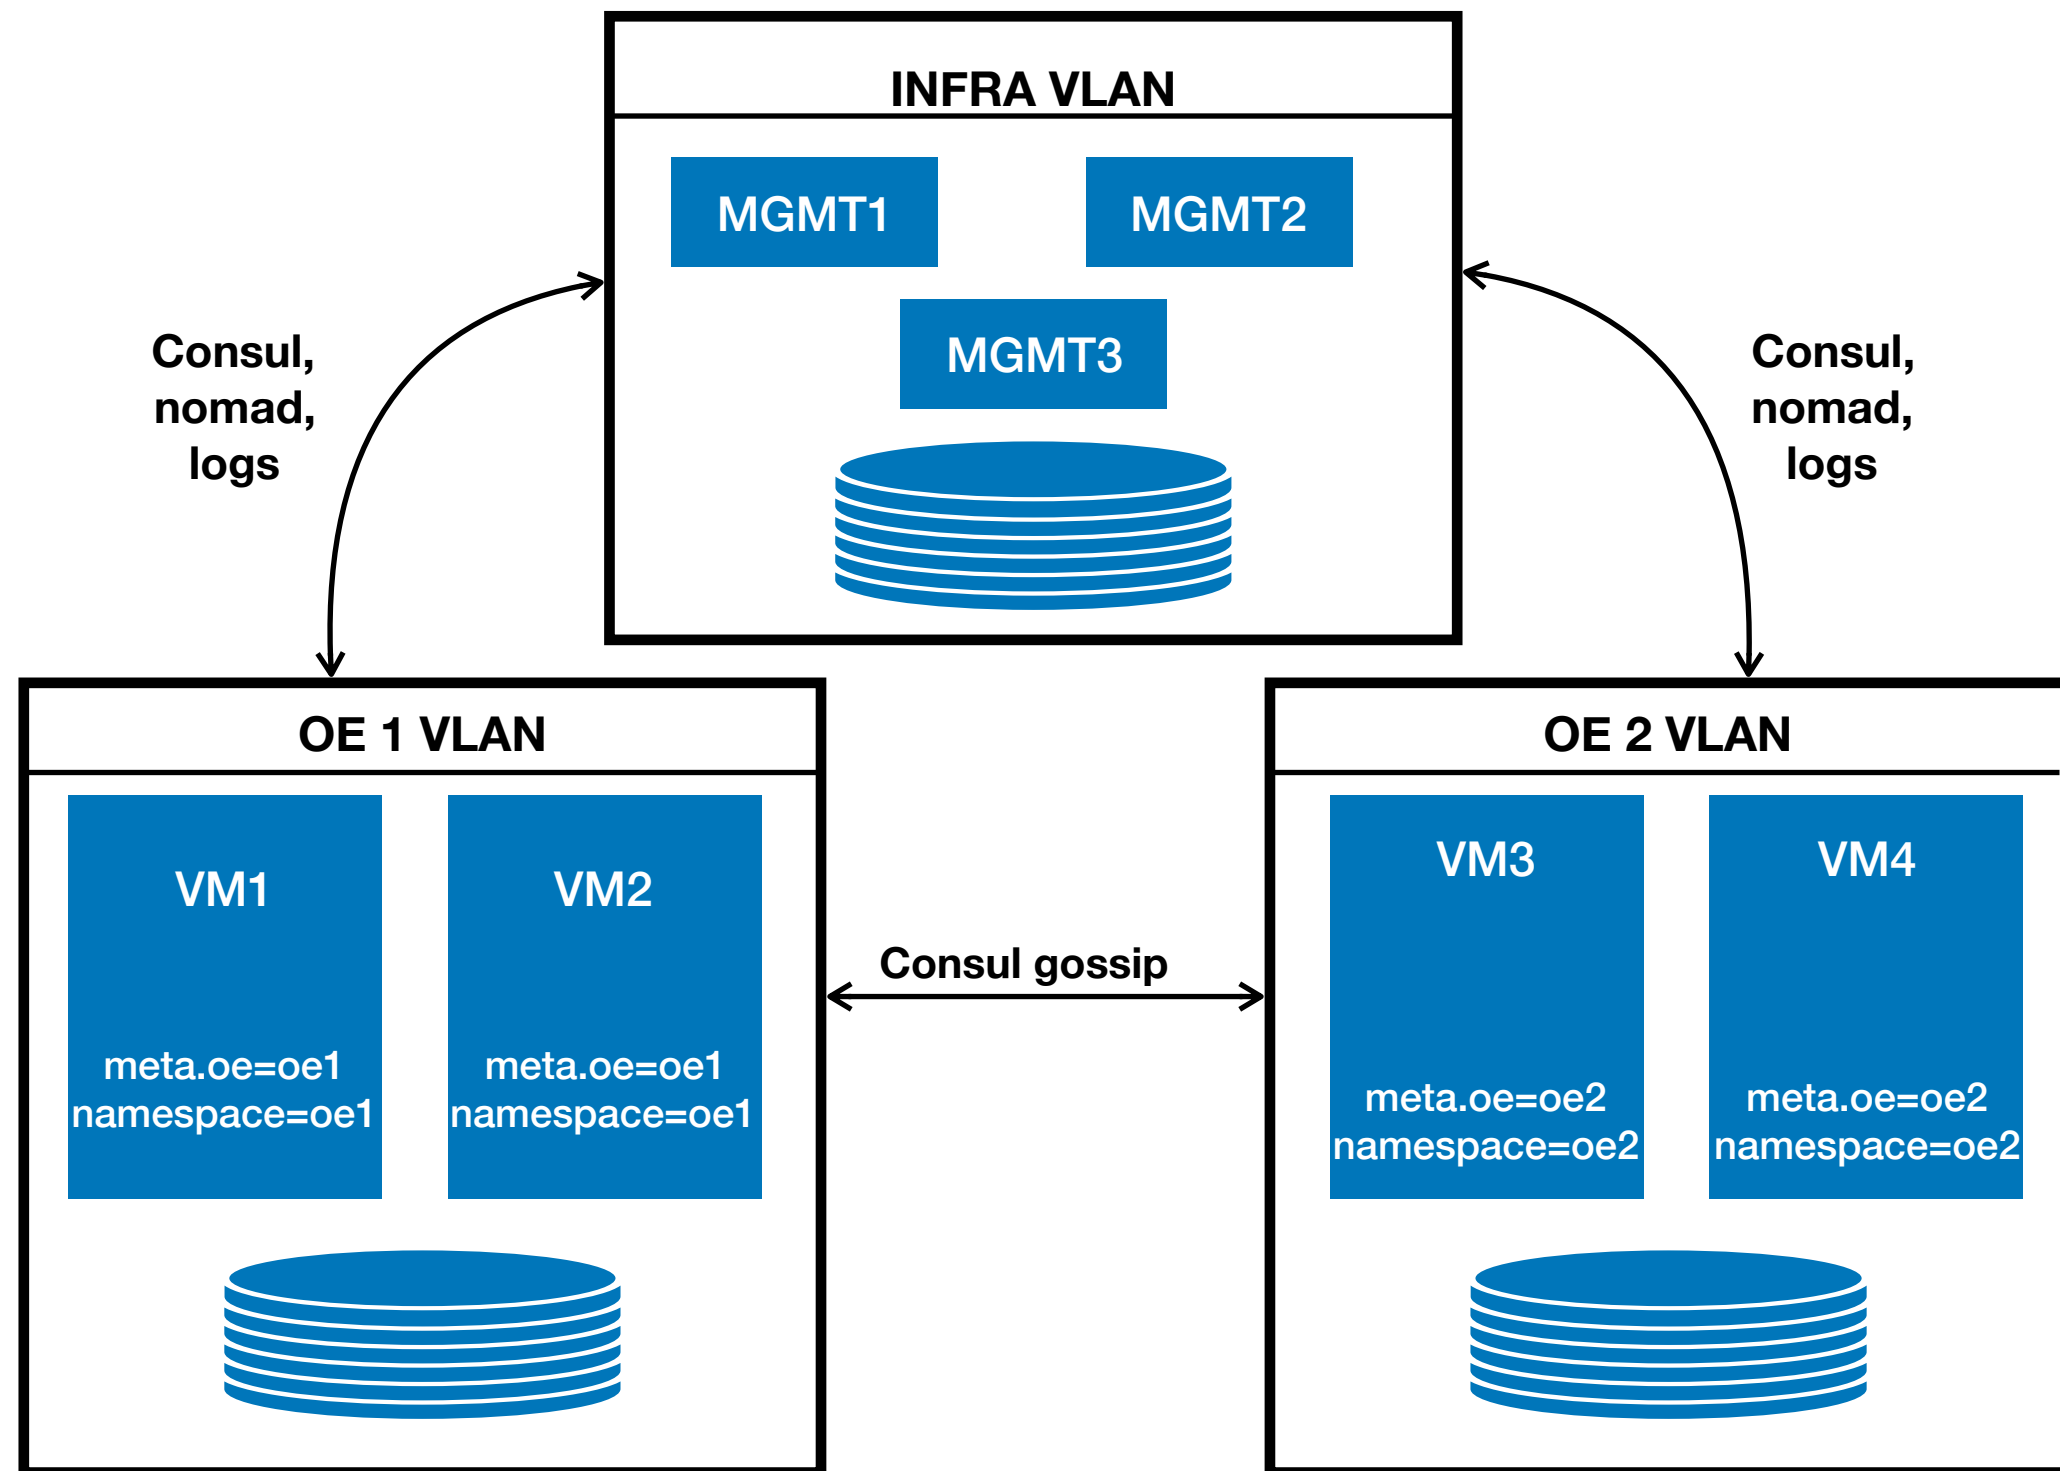

Final Design

- Single namespace per OE
- Sentinel checks for customer-created jobs
- Introduce ACLs to Broccoli

Option 3: Centralised Nomad(EE)

Thank you
